## 1 Mon Lec, 5

### 1.1 a

$|K| = 6$ , let  $e$  be the identity transformation and  $r$  be a rotation of  $\frac{360}{6} = 60^\circ$ .  
The other elements are:  $r^2, r^3, r^4, r^5$

### 1.2 b

Since  $D_6$  is the group of all symmetries,  $K$  is only the rotational ones, and  $D_6$  also contains reflective symmetries. Therefore  $K$  is a subgroup of  $D_6$

### 1.3 c

Let our generator  $\omega = r$ ,  $\omega^0 = e$ ,  $\omega^1 = r$ ,  $\omega^2 = r^2$ , and so on. It is a generator because its powers can generate all the elements of our group.

### 1.4 d

Let our generator  $\omega = r^5$ ,  $\omega^0 = e$ ,  $\omega^1 = r^5$ ,  $\omega^2 = r^4$ ,  $\omega^3 = r^3$  etc.

|                |                |                |                |
|----------------|----------------|----------------|----------------|
| e              | b <sub>1</sub> | b <sub>2</sub> | r              |
| e              | e              | b <sub>1</sub> | b <sub>2</sub> |
| b <sub>1</sub> | b <sub>1</sub> | e              | r              |
| b <sub>2</sub> | b <sub>2</sub> | r              | e              |
| r              | r              | b <sub>2</sub> | b <sub>1</sub> |

e  
e e

*no rotational or reflective symmetry*

*Take an equilateral triangle and add "legs" to it. This way it is no longer reflectively ~~rotational~~ symmetric.*

LEC WED

3

(b)  $\begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 \\ 7 & 6 & 4 & 1 & 3 & 5 & 2 \end{pmatrix}$

$1 \rightarrow 7 \rightarrow 7$   
 $2 \rightarrow 6 \rightarrow 6 \dots$

(c)  $\begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 \\ 5 & 1 & 2 & 3 & 6 & 4 \end{pmatrix}$   
 $5 \rightarrow 4 \quad 6 \rightarrow 4$

$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\ 1 & 7 & 8 & 2 & 4 & 6 & 5 & 3 \end{pmatrix}$

$8 \rightarrow 3 \rightarrow 8 \rightarrow 3$

$7 \rightarrow 2 \rightarrow 4 \rightarrow 5$

$6 \rightarrow 6 \dots$

$5 \rightarrow 7 \rightarrow 2 \rightarrow 4$

$$4. (1342)(123) = (1\ 4\ 3\ 2)$$

$$(1534269)^{-1} = (9\ 6\ 2\ 4\ 3\ 5\ 1)$$

5a. The order of a permutation  $P$  is the smallest integer  $s$  such that  $P^s = I$  (Identity).

Let  $P = P_1 P_2 \dots P_n$ ,  $x_i \in P_1 \cup P_2 \dots \cup P_n$ . If  $x_i \in P_1$ ,  $s$  must be a multiple of  $|P_1|$ , the same is true for all  $P_2, P_3 \dots P_n$ .  $s$  must be a multiple of  $|P_2| \dots |P_n|$  to ensure that  $P^s$  maps  $x$  to  $x$ . Therefore  $|P| = \text{lcm}(|P_1| \dots |P_n|)$ .

DIS WED

$$6b. (1\ 3\ 6\ 7\ 4\ 8\ 10) \Rightarrow \begin{matrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\ 3 & 2 & 6 & 8 & 5 & 7 & 4 & 10 & 9 & 1 \end{matrix}$$

$$\Rightarrow (1\ 3)(1\ 6)(1\ 7)(1\ 4)(1\ 8)(1\ 10) \quad \text{even}$$

$$9e. (25)^{-1} = (5\ 2)$$

$$[(25)(63)]^{-1} = (36)(52)$$

$$[(25)(256)]^{-1} = (652)(52)$$

$$(153429)^{-1} = (9\ 2\ 4\ 3\ 5\ 1)$$

$$[(1342)(123)]^{-1} = (3\ 2\ 1)(2\ 4\ 3\ 1)$$

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\ 3 & 2 & 5 & 6 & 7 & 8 & 1 & 4 \end{pmatrix}^{-1} = [(3\ 5\ 7\ 1)(4\ 6\ 8)]^{-1} = (8\ 6\ 4)(1\ 7\ 5\ 3)$$

6. Since block 16 (the empty block) is at the same spot, and shifts can be written as a product of transpositions, any shift up must have a shift down. The same for left and right. Thus the total oddity must be

|    |    |    |    |
|----|----|----|----|
| 1  | 2  | 3  | 4  |
| 5  | 6  | 7  | 8  |
| 9  | 10 | 11 | 12 |
| 13 | 14 | 15 |    |

is the identity, reachable

|    |    |    |   |
|----|----|----|---|
| 4  | 3  | 2  | 1 |
| 5  | 6  | 7  | 8 |
| 12 | 11 | 10 | 9 |
| 13 | 14 | 15 |   |

$= (14)(23)$   
 $= (912)(1011)$  } even permutations, reachable

|    |    |    |   |
|----|----|----|---|
| 10 | 9  | 8  | 7 |
| 11 | 2  | 1  | 6 |
| 12 | 3  | 4  | 5 |
| 13 | 14 | 15 |   |

$= (1\ 10\ 3\ 8\ 6\ 2\ 9\ 12\ 5\ 11\ 4\ 7)$

size 12 cycle  $\Rightarrow$  odd # of transpositions, not reachable

|    |    |    |   |
|----|----|----|---|
| 8  | 14 | 11 | 3 |
| 12 | 2  | 15 | 9 |
| 6  | 4  | 13 | 1 |
| 7  | 10 | 5  |   |

$= (1\ 8\ 9\ 6\ 2\ 14\ 10\ 4\ 3\ 11\ 13\ 7\ 15\ 5\ 12)$

size 15 cycle  $\Rightarrow$  even #, solvable

76. Assuming that the rest of the puzzle is complete:

|   |    |    |    |
|---|----|----|----|
| 1 | 2  | 3  | 4  |
| 5 | 6  | 7  | 8  |
| 9 | 10 | 11 | 12 |
| ? | ?  | ?  |    |

We know that the only even permutations are  
 13 14 15, 14 15 13, 15 13 14. One is already  
 the identity, for the rest we do the following

|    |    |    |    |
|----|----|----|----|
| 1  | 2  | 3  | 4  |
| 5  | 6  | 7  | 8  |
| 9  | 10 | 11 | 12 |
| 14 | 15 | 13 |    |

$\Rightarrow$ 

|    |    |    |    |
|----|----|----|----|
| 1  | 2  | 3  | 4  |
| 5  | 6  | 7  | 8  |
| 14 | 9  | 10 | 11 |
| 15 | 13 | 12 |    |

$\Rightarrow$ 

|    |    |    |    |
|----|----|----|----|
| 1  | 2  | 3  | 4  |
| 5  | 6  | 7  | 8  |
| 14 | 13 | 9  | 11 |
| 15 | 10 | 12 |    |

$\Rightarrow$ 

|    |    |    |    |
|----|----|----|----|
| 1  | 2  | 3  | 4  |
| 5  | 6  | 7  | 8  |
| 13 | 15 | 9  | 11 |
| 14 | 15 | 10 | 12 |

$\Rightarrow$ 

|    |    |    |    |
|----|----|----|----|
| 1  | 2  | 3  | 4  |
| 5  | 6  | 7  | 8  |
| 13 | 9  | 10 | 11 |
| 14 | 15 | 12 |    |

$\downarrow$   

|    |    |    |    |
|----|----|----|----|
| 1  | 2  | 3  | 4  |
| 5  | 6  | 7  | 8  |
| 9  | 10 | 11 | 12 |
| 13 | 14 | 15 |    |

Since  $(15 \ 13 \ 14) = (14, 15, 13)^2$ , applying this algorithm twice yields the desired result.

Mon Lec

Consider a group of size 4, since it is a group, it is closed and has an identity

|     |     |     |     |     |
|-----|-----|-----|-----|-----|
|     | $e$ | $l$ | $r$ | $b$ |
| $e$ | $e$ | $l$ | $r$ | $b$ |
| $l$ | $l$ |     |     |     |
| $r$ | $r$ |     |     |     |
| $b$ | $b$ |     |     |     |

Each element has to appear in a row. If  $l \cdot l \neq e$ , then  $lb$  or  $lr$  must be  $e$ . In this case it is the cyclic group since it is isomorphic to  $\mathbb{Z}_4$ , the numbers rotate like on a wheel.

If  $l \cdot l = e$ , then it is the Klein group. each element times itself is the identity and  $lr=b$  since neither is the identity and  $e$  has already appeared. Thus it must be isomorphic to the Klein group.
